

TBACKUP Utility

❖ *This utility provides the LAN administrator with access on the file server for each group.*

1. From a workstation, map drives to each volume on the NetWare server being assessed.
2. Copy tbackup.exe and tbackup.msg from NetWare and copy to the root of the volume of the server being assessed.
 - ❖ NOTE: If more than one volume exists, the files will need to be copied to each volume on the server.
3. Go to a DOS prompt and switch to the specific drive letter.
4. Run the command “tbackup /s”.
5. The utility will run for a while—the length of time depends on the amount of data on the server—then creates a file called “trestore.bat” onto the root of the volume being assessed.
6. Using a text editor, for example, MS Word, open the file and print it.

Group Show Command

❖ *This command dumps out group membership*

1. From a workstation, shell out to a DOS prompt
2. Set your context to the correct container using the CX command.
For example: CX .KEJ.KEG.KII

3. Type the following command to see the group membership:

NLIST GROUP SHOW “MEMBER”

4. The information can then be piped over to a file.

NLIST GROUP SHOW “MEMBER”>MEMBERS.TXT
