Why Consolidation? - The Business Issues

- ✓ It's about controlling cost of management.
- ✓ While increasing the responsiveness of the lines of business.

Invent
Design
Deliver

Technical
Computing — POWER for the next e

Agenda

- ✓ **Consolidation Process**
 - Consolidation Platform
 - Consolidation Tools - ServiceControl
 - Application Consolidation
 - Case Studies
 - More Information/Contacts

Invent
Design

Consolidation Process

Consolidation Process

Assessment

- Questionnaire
- Qualification
- Measureware
- TCO Study
- Tools
- Identify Constraints

Analysis

- Tools
- Spreadsheets
- Workshop
- Application Isolation
- **Application Consolidation**
- Servers

Design

- Products
- Interconnect
- FibreChannel
- Backup
- Management
- **Middleware**
- Identify target environment

Ordering

- Design Template
- Config Guides
- White Papers
- WEB sites
- Training
- Site Prep.

Implementation

- Installation Guidelines
- Pilot Project
- Documentation

Consolidation of computing systems reduces administration overhead, allows better utilization of computing resources, saves physical space, and reduces the burden of asset management. Consolidation requires careful planning, new strategies, and the right tools.

HP 9000 HyperPlex Solution Summary

Large performance capacity

- Select from entire HP 9000 server family
- Mixed server model and HP-UX version
- Capacity to 64+ nodes (8,192 CPUs)

Support for multiple communications protocols

- Standard TCP/IP
- Future, ultra-low-latency protocols

Central administration and management

Pre-integrated HP ServiceControl

- ServiceControl Manager
- Workload/Application control
- Resource management
- High Availability
- Performance management tools

Wide range of scalable multi-system mass-storage devices

- EMC
- FC/Model 12H
- Model 30
- FC Arbitrated Loop hub
- FC SCSI multiplexer

Connectivity products

- HP HyperFabric
- FDDI
- 10/100Base-T
- Gigabit Ethernet
- ATM

Dense data center racking

- Two V-Class stacked
- Four N-Class per rack
- Three K-Class per rack (field only)
- Five L-Class per rack
- Six D-Class per rack (field only)
- Six R-Class per rack

Dynamic Application Rehosting within an HP HyperPlex with MC/ServiceGuard

- Minimize planned service interruptions
- Hardware/software upgrades or maintenance
- Re-Balance workloads and processing priorities with PRM

Invent
Design
Deliver

Technical
Computing — POWER for the next e

Benefits of MC/ServiceGuard

- Completely transparent to applications
- Intelligent cluster reconfiguration after node failure
 - Data Integrity: No split-brain syndrome
 - Dynamic formation of new, viable cluster
- Flexible load balancing
- Mixed Series 800 class nodes
- Facilitates online hardware and software updates
- Highly available Enterprise Cluster
 - Fast sw itching of applications to alternate node (<60 seconds for basic system resources with JFS)
 - LAN failure protection (very fast local sw itch to standby LAN adapter inside same node)
- Application Packages
 - Easy application management
 - Flexible recovery options
- No idle resources
 - All systems run mission-critical applications

Workload Management — HP Process Resource Manager (PRM)

Allocate available processing resources according to business priority

- Provides Greater Control Over the CPU by Guaranteeing Users, Groups of Users, or Applications
 - A Maximum % of the CPU processing power
 - A Maximum % of Real Memory
 - A Minimum % Disk I/O
- All entitlements are dynamically changeable
- Hard and soft CPU and memory limits
- GPL integration allows automatic reconfiguration based on service level objectives
- ✓ Analysis tool, **prmanalyze**, for resource accounting

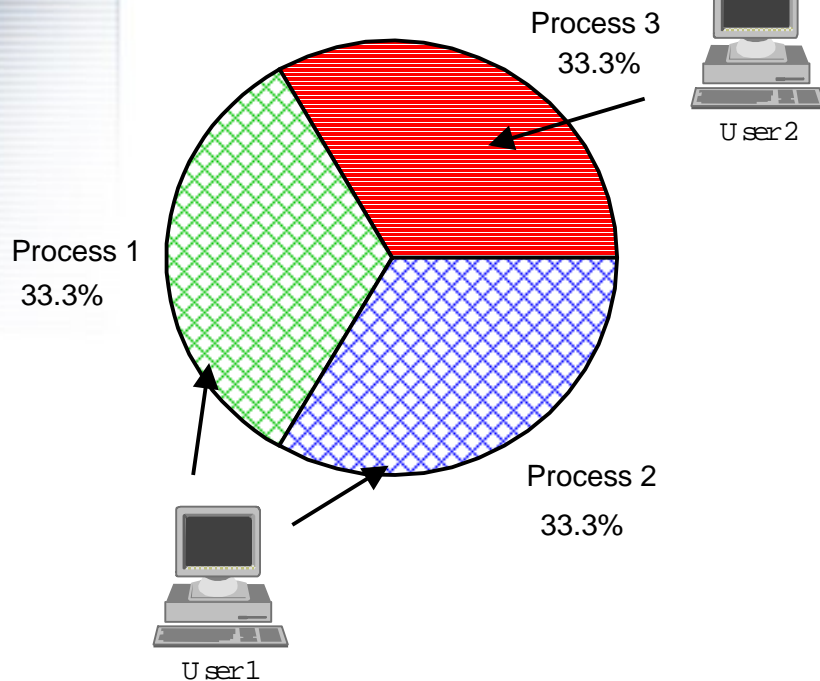

- A must for every HP-UX server with 2 or more applications
- Enables a server consolidation strategy
- Compliments HP MC/ServiceGuard

Invent
Design
Deliver

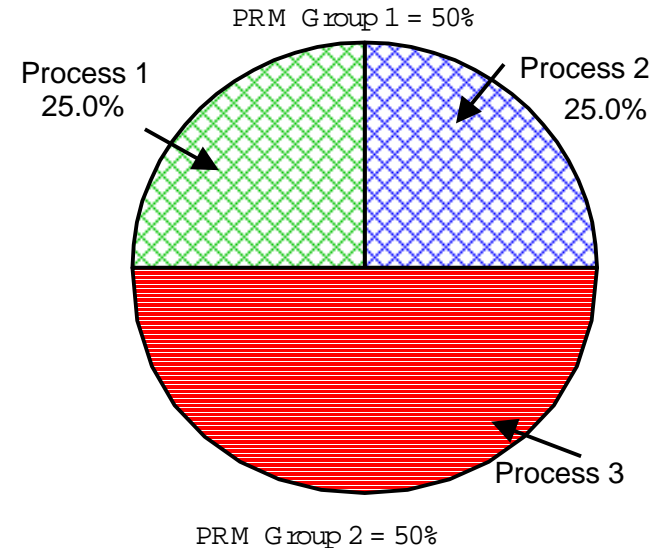

The PRM Advantage

Standard UNIX Scheduler

- Each process gets equal priority - User 1 gets 66.6%
- UNIX Scheduler controls process priorities. Priority is lowered as processes consume more and more CPU

PRM Scheduler with HP/UX

- CPU allocation in line with business priorities
- Provides a method to implement and manage service level objectives
- PRM entitlements determine % of 10ms execution timeslots

Invent
Design
Deliver

Using PRM with MC/ServiceGuard: Consistent service delivery for critical applications

Strict response time requirement for Application C

100%

Node 1

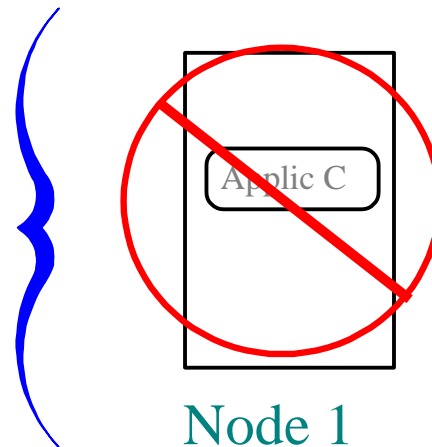

80%

20%

Node 2

- Dynamic allocation of CPU
- Load balancing for normal and post-failure operation

If Node 1 fails, dynamically re-allocate processing resources of Node 2

Node 1

70%

20%

10%

Node 2

Hyperplex Solution Example: After Resource Balancing

(Multiple Apps. with High Availability)

Invent
Design
Deliver

HP-UX Workload Manager (HP-UX WLM)

Examples of Service Level Objectives (SLOs)

Application A

- Transactions will complete in less than 1 second.

Priority 1

Application B

- Batch job will finish in less than 1 hour.

Priority 2

Application C

- 50% of CPU allocation

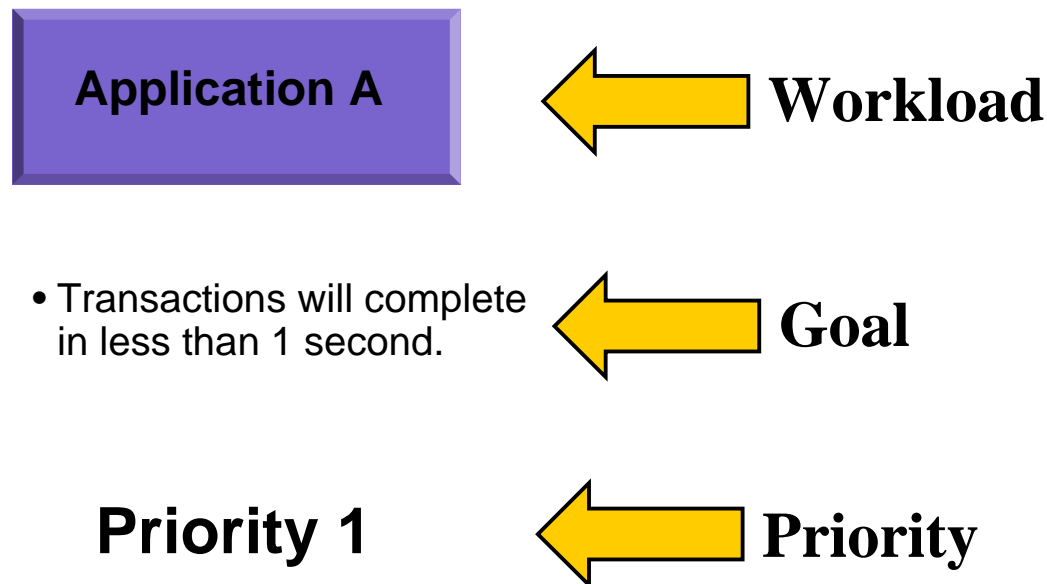

Priority 3

HP-UX WLM automatically reconfigures CPU entitlements depending on priority and set SLOs

HP-UX Workload Manager (HP-UX WLM)

What is an SLO?

An SLO consists of a workload, a goal, and a priority for that goal.

Invent
Design
Deliver

Technical
Computing — POWER for the next e

HP-UX Workload Manager (HP-UX WLM)

What else is in an SLO?

Application A

And...

- Transactions will complete in less than 1 second.

Conditions:

- Mon-Fri, 9am-5pm

Constraints:

- No less than 10% CPU
- No more than 50%

Priority 1

Each goal has conditions under which it applies, and resource constraints.

Invent
Design
Deliver

HP-UX Workload Manager (HP-UX WLM)

How is goal achievement measured?

Application A

- Transactions will complete in less than 1 second.
- Collection of performance data via Application Response Measurement or non-invasive means.

Application B

- Batch job will finish in less than 1 hour.
- Collection of performance data from existing kernel instrumentation.

Application C

- 50% of CPU allocation
- No instrumentation required.

HP-UX WLM automatically reconfigures CPU entitlements depending on priority and set SLOs

Invent
Design
Deliver

Technical
Computing — POWER for the next e

HP-UX Workload Manager (HP-UX WLM)

Example uses of HP-UX WLM.

Application A

- **OLTP Response-time goals**
- Ex: Online Retail price quote lookup in less than 2 seconds.

Application B

- **Schedule PRM Entitlements.**
- Ex: End-of-month Financials.

Application C

- **Event-based PRM entitlement change**
- Ex: Increase Oracle CPU entitlement by 5% for each additional user connection.

Mix-and-match different goals on the same server. CPU allocation is driven by priority.

Technical
Computing — POWER for the next e

What are Memory Windows?

- Memory Windows remove the 1.75 GB system-wide shared resources limit (for shared memory and memory-mapped files). Note: a per-process limit of 1.75 GB still exists for 32-bit apps.
- This was a major inhibitor to running multiple 32-bit applications on large memory systems such as V-class (16 GB real memory)
- With memory windows, there is one global shared resources window (max size 1.75 GB), and up to 128 private ones (max size 1 GB each).
- Provides isolation of shared resource regions across different applications
- Very easy to implement using the "**setmemwindow**" command

Types of Application Consolidation

- **Consolidation of a Distributed Client-Server or Multi-Tier Application**
 - a) “Only change the hardware”
 - Run the application on fewer, larger systems
 - combine multiple instances onto one server
 - combine app servers and DB servers onto common servers
 - b) Redundancy reduction
 - Reduce the number of instances of the application to process a given workload
- **Application Stacking**

Consolidate multiple (diverse) applications on fewer, larger systems

Invent
Design
Deliver

Technical
Computing — POWER for the next e

Only Change the Hardware

Run the application on fewer, larger systems - without changing the application's software architecture or number of application instances.

Before:

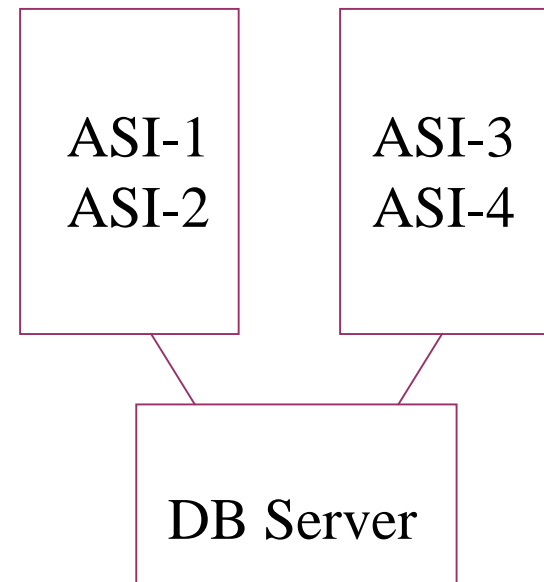

After:

Four App Server Instances (ASI), 1 per box

Four App Server Instances, 2 per box.

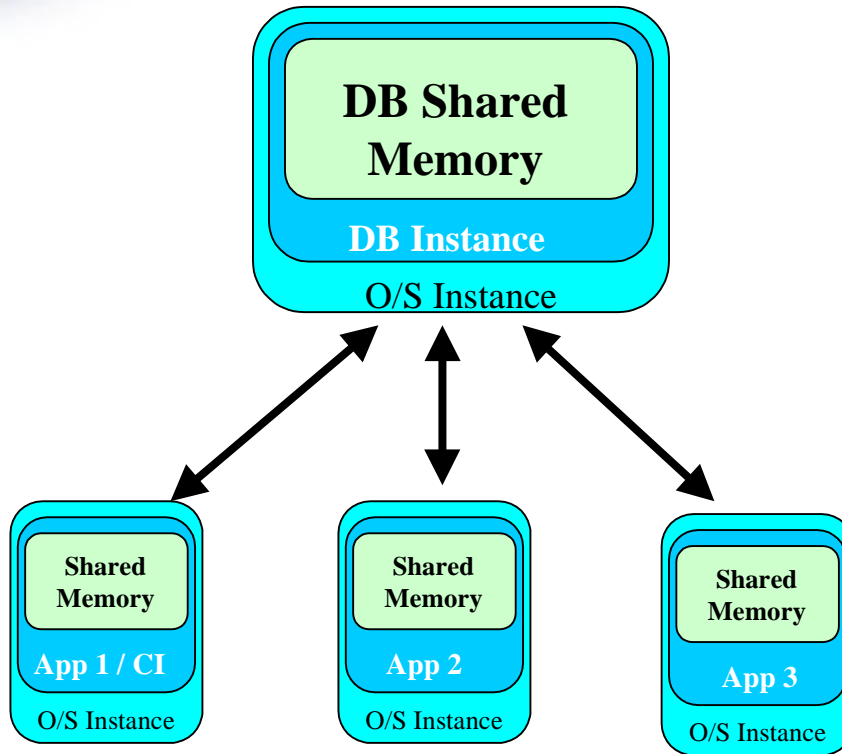

Invent
Design
Deliver

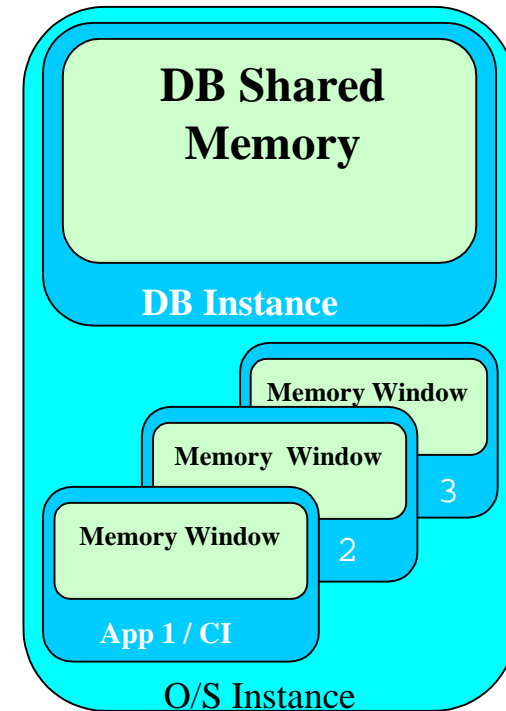

SAP Consolidation - example

Traditional:

- Multiple OS to manage
- Up to 10% Network overhead
- Footprint

State of the art:

Superior CPU Power
RAM up to 32 GB

→ Reduced complexity - reduced TCO

Invent
Design
Deliver

Redundancy Reduction

Reduce the number of instances of the application to process a given workload.

Before:

After:

Four App Server Instances (ASI), 1 per box

Two App Server Instances, 1 per box.

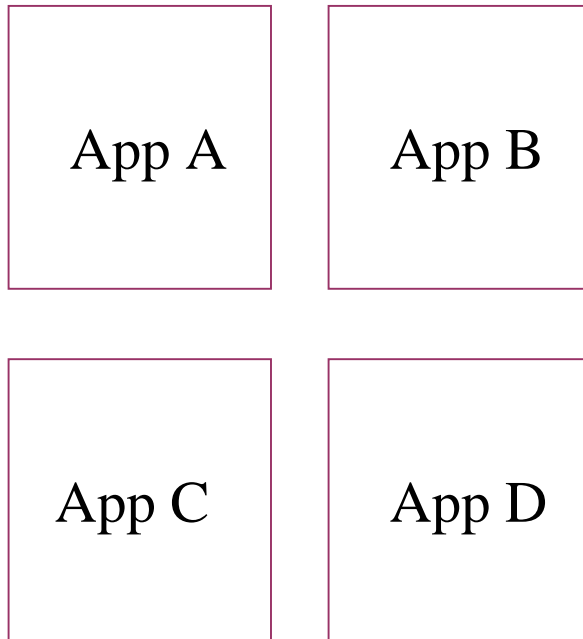

Application Stacking

Consolidate multiple (diverse) applications on fewer, larger systems

Before:

After:

Four different applications on four servers (1 per box) to four different applications all on one server.

Computing — POWER for the next e

Guidelines for Running Multiple Applications per Server

- It is generally safe to run multiple instances of the same application on one OS image (e.g. multiple instances of Oracle, or multiple instances of SAP)
- It is often safe to combine application servers and database servers onto a common server - example: SAP and Oracle; Oracle Financials and Oracle Database.
- Applications that are intensive on different resources (eg: CPU intensive vs I/O intensive) or at different times (example Batch and OLTP) are good consolidation candidates.

Invent
Design
Deliver

Technical
Computing — POWER for the next e

Guidelines - continued

- Firewall/Security products require dedicated servers.
- Old home grown applications are generally not the first choice of application consolidation candidates. But ...
- It is generally not recommended to share servers across business units unless there is high level management commitment and sponsorship
- There is **NO** substitute for testing

Invent
Design
Deliver

Technical
Computing — POWER for the next e

Guidelines - continued

- Analyze Application Characteristics
 - Mission Critical? Stability, Resource Requirements
- Making Them Work Together
 - ServiceControl - MC/ServiceGuard, PRM, Memory Windows
- Sizing System Hardware
 - HP Measureware Data for CPU, Memory, Disk I/O, Networking
- Kernel Tuning
- Security

TCO for Systems Consolidation - Case Study

EXISTING Environment

- Entire environment: **56 Servers**
- Chosen candidates: **43 Servers**
- Entirely purchased, nothing financed
- High content of personnel cost
- Existing monthly cost of use = **382K\$**

Phase I PROPOSED Environment

- **17** existing Servers plus **6** new N-classes plus upgrades
- Finance proposal on 36 month lease
- **13.4%** lower operational costs incl. start-up costs (excluding personnel savings)
- Future monthly cost of use = **331K\$**

Phase II PROPOSAL

- Decrease System Administration resources (**26** to **15** people) expected savings **37.8%**
- Future monthly cost of use = **248K\$**

Fortune 20 Company in Petroleum Industry Stacks Databases

Situation

- IT realized server proliferation was getting out of hand
- IT decided to consolidate servers and mass storage

Solution: "the Compute Utility"

- Two to three Oracle instances are stacked on a K-class server where an EMC enclosure provides disk storage
- PRM guarantees CPU percentage for each Oracle instance
- IT sells CPU percentage and disk storage to the business units

Dear HP Customer!

Would you like to influence new and existing HP products and solutions?
Is your company implementing DataWarehousing or Server Consolidation?

If so, HP's Business Critical Computing R&D labs might want to invite you to visit our site in Cupertino so that:

- Our R&D community can learn more about your company and how you use HP's DataWarehousing and Consolidation solutions.
- You can provide us with input on our products.

If you are interested, please contact:

Carolyn Godfrey, 408-447-4074, carolyn_godfrey@hp.com
